## **DETAILED ACTION**

### ***Continued Examination Under 37 CFR 1.114***

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 7/5/2007 has been entered.

### ***Claim Rejections - 35 USC § 103***

2. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Claims 1-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kato (US20020138968 to Kato et al.) in view of Habert (US3714484).

The rejection is maintained as presented in the Office Action mailed on 3/5/2007. The references still apply to the claims as amended.

### ***Response to Arguments***

3. Applicant's arguments filed 7/5/2007 have been fully considered but they are not persuasive.

Applicant argues that Kato does not disclose applying a forming pressure radially towards the blank axis to form the tapered surface on only one side of the claws, and that Habert does not disclose how the reliefs 9 are formed. Therefore, Applicant argues,

assuming that it would have been obvious to combine Kato and Habert, still no hint would be given as to the method used to obtain the claimed structure.

The Examiner respectfully disagrees. Kato discloses forming a claw rotor core by applying radial pressure to a blank and thus pressure-forming the desired structure. As discussed in the final rejection, Habert teaches that a desired feature in claw pole rotors is a tapered surface on only one side of each claw pole, so as to reduce noise. One of ordinary skill in the art would have found it obvious to provide a suitable die when employing the method of Kato, so that upon applying pressure to the blank, the resulting structure has the desired tapered surface. Changes to the dies of an apparatus to produce a desired deformation on a blank would have merely required routine skill in the art.
